# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatisms other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease." It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis.

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Ports of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

#### All Causes: Disease and Injury:

During the week ending 15 December 1944 the admission rate from all causes decreased fractionally to 607 per year per thousand strength. The current week's morbidity is almost 50 percent lower than during the corresponding week of 1943, when an outbreak of common respiratory infections had reached its peak. Morbidity from disease, likewise, decreased slightly during the current week to 550 per thousand strength.

The admission rate from injury declined to 57 per thousand, which closely approximates the average rate for the previous three weeks. The present experience is not strictly comparable with rates reported prior to October since this reflects in large part compliance with the recently issued directive which provided that injuries existing prior to entry into active service and readmitted cases should be recorded under "disease" rather than under "injury;" previously they had been reported as "injuries."

#### Respiratory Causes:

Morbidity from colds, influenza, etc. decreased fractionally from 121 per thousand in the previous week to 120 per thousand. Nonetheless, the current week's experience is about 30 percent higher than that which prevailed during October and November. Because during this period of 1943 there was a sharp outbreak of upper respiratory infections, the current week's admission rate from colds, influenza, etc. is about 80 percent lower than for the corresponding week of 1943.

The admission rate from pneumonia increased slightly to 11 per thousand. Morbidity from this cause is almost 50 percent below that for the corresponding week of 1943.

### Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service remained at 39 per thousand for the third consecutive week. The current experience is thus about 5 percent under the record high rate registered for this year during the final weeks of October and November. However, current morbidity is about 60 percent higher than during the corresponding week of 1943.

Morbidity from diarrhea and dysentery continued at the relatively low seasonal level of 7 per thousand. The number of new cases of meningitis increased somewhat to 22, which is only slightly higher than the average weekly number during recent months but is well below the experience of the corresponding period of 1943. The number of new cases of rheumatic fever decreased sharply from 88 in the previous week to 51 in the current week, as a result of the drop in the number of cases reported by the Ninth Service Command.

### VARIATIONS IN MORBIDITY BY SERVICE COMMAND

#### All Causes: Disease and Injury:

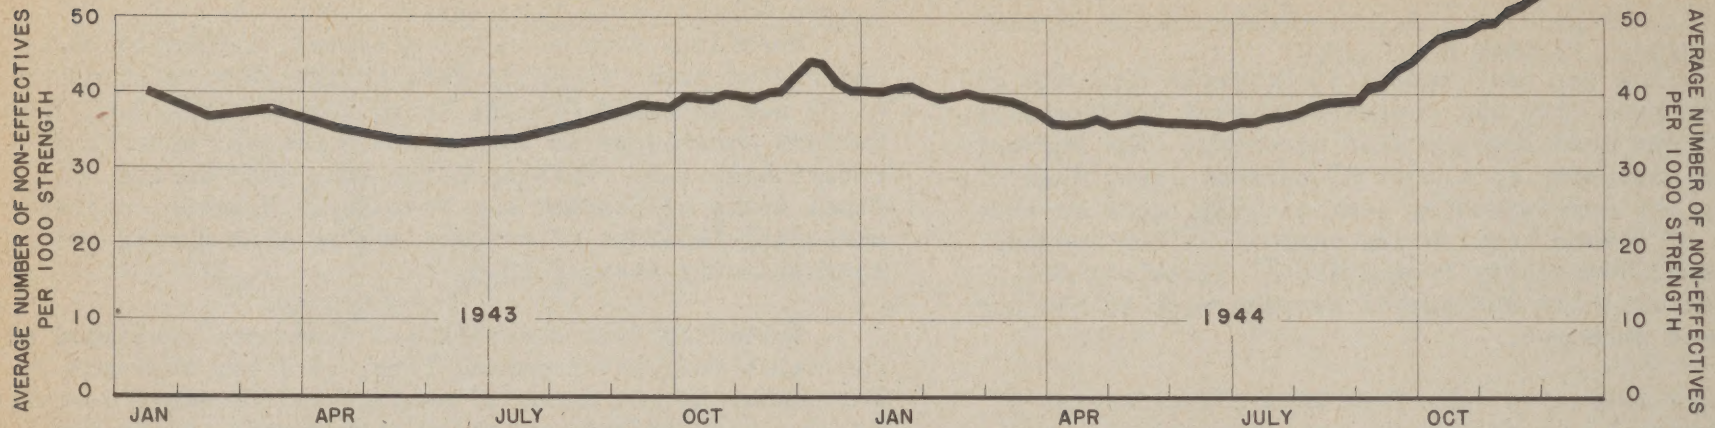

The admission rate from disease increased sharply in the First Service Command, while significant decreases were reported from the Fifth and Sixth Service Commands, with the majority of the Service Commands reporting relatively little change.

The First, Second, and Third Service Commands reported the highest morbidity from all causes (about 735 per thousand) and from disease (about 685 per thousand). The lowest morbidity from all causes (about 550 per thousand) and from disease (about 490 per thousand) were registered in the Fifth and Eighth Service Commands, closely followed by the Seventh and Ninth Service Commands.

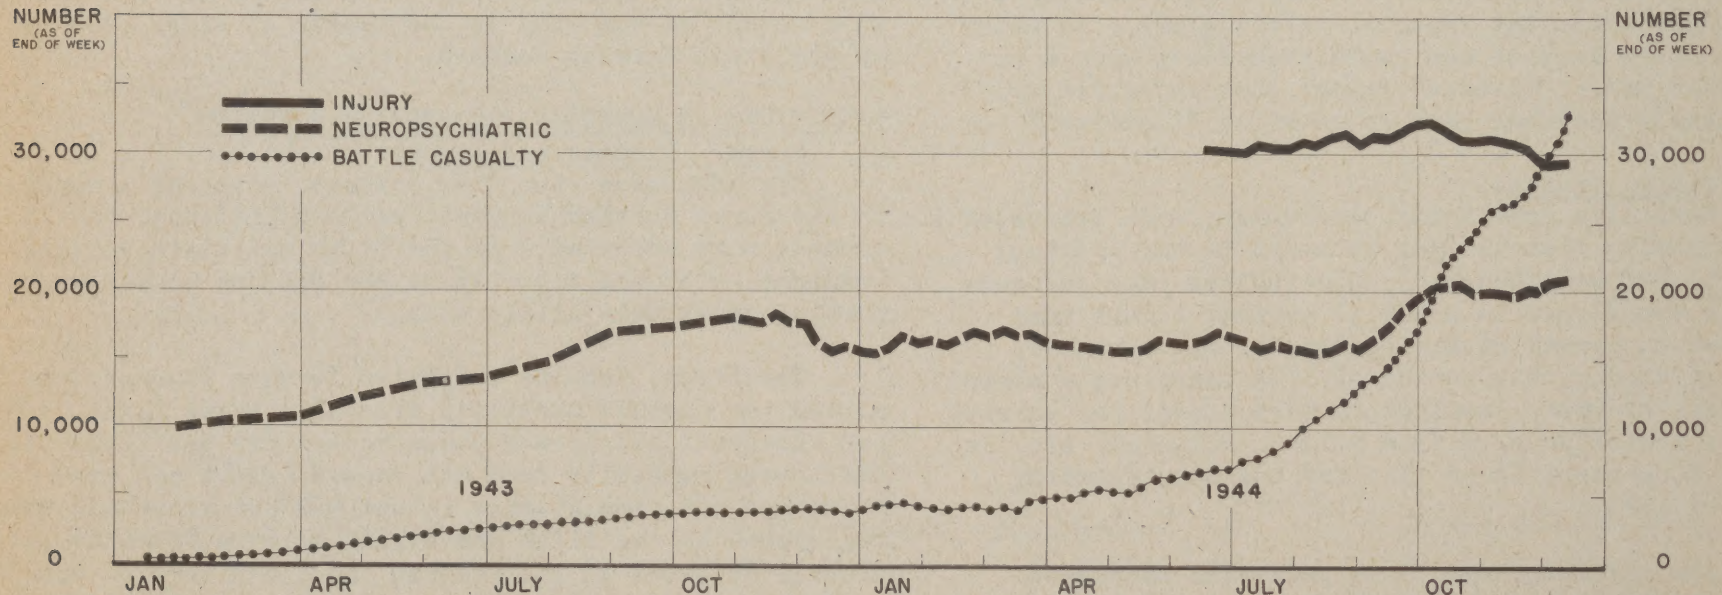

# NON-EFFECTIVE RATE

## CONTINENTAL UNITED STATES

# PATIENTS REMAINING UNDER TREATMENT

## CONTINENTAL UNITED STATES

## COMMENT ON CURRENT TRENDS (CONT'D)

The admission rate from injury increased sharply in the First and Sixth Service Commands and decreased significantly in the Fourth Service Command. Nevertheless, the Fourth Service Command continued to report the highest admission rate (67 per thousand) and in fact was the only one to report morbidity in excess of 60 per thousand.

Respiratory Causes:

The admission rate from colds, influenza, etc. remained relatively unchanged in most Service Commands. A sizeable increase was reported by the Third Service Command, while only the Sixth and Seventh Service Commands reported relatively large drops. The Sixth Service Command continued to report the highest morbidity from colds, influenza, etc. (159 per thousand), followed by the Third Service Command (150 per thousand). The lowest admission rate was reported by the Seventh Service Command (101 per thousand).

Morbidity from pneumonia showed only minor fluctuations by Service Command as compared with the previous week. The Sixth Service Command, with a rate of 17 per thousand, continued to report the highest morbidity from this cause.

Common Communicable Diseases:

Morbidity from "new" venereal diseases (excluding EPTS) showed considerable fluctuation by Service Command despite the rate for the country as a whole remaining the same. Sizeable increases were reported by the First and Third Service Commands, while notable decreases were registered in the Fifth, Sixth, and Seventh Service Commands. As a result, for the first time in several weeks the Fifth Service Command did not report the highest morbidity from these causes, being supplanted by the Third Service Command with a rate of 62 per thousand.

Morbidity from diarrhea and dysentery continued low in all Service Commands, with none reporting a rate of 10 per thousand or greater. There were no significant changes reported in the number of cases of the other communicable diseases considered in the following tables.

NON-EFFECTIVE RATE:

The non-effective rate increased for the twenty-second consecutive week to 55.7 per thousand; this is the highest rate recorded during this war. More than 30 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

PATIENTS REMAINING UNDER TREATMENT: 15 December 1944:

The number of neuropsychiatric cases remaining was reported at 20,868 or about 200 more than at the end of the previous week and thus the highest reported so far in this war. The number of non-battle injury patients remaining was again reported at about 29,200. The number of battle casualty patients remaining increased by about 2000 to number 33,226.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 15 December there were 4,310 enlisted men discharged by CDD or about 100 less than the previous week. About 50 percent of these discharges were reported by General Hospitals. Included among the 4,310 CDD's were 1,558 neuropsychiatric cases.

# COMMENT ON RECENT DEVELOPMENTS

FOR THE FOUR WEEK PERIOD ENDING 24 NOVEMBER 1944

## NATURE OF THE DATA:

The data of this Monthly Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 24 November 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 25. Similar charts for specified diseases appear on pages 27, 29, and 31. A chart showing mortality trends is presented on page 33. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 34. The most pertinent morbidity data for individual stations are presented on pages 35 to 60. On pages 61 and 62 the seven stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates

based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

## MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Admission rates from all causes and from disease decreased fractionally (by about 2 percent) in November. The Navy's shore stations in the continental U.S. also reported about the same morbidity in November as in October.

Morbidity from disease during November was about 5 percent above the minimum rates for the year registered during July and August but well under the experience of the winter and spring months. The November admission rate from disease (494 per year per thousand strength) was 18 percent below the rate for November 1943, during the latter part of which month there began a sharp outbreak of respiratory infections.

The admission rate from injury decreased to 61 per thousand which is the lowest rate reported in the last three years; however, the present experience is not strictly comparable with that prior to October because the current relatively low level of injuries reflects compliance with the recently issued directive which required readmitted and EPTS injuries to be reported as "disease" and not as "injury."

Lower morbidity from disease for November as com-

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

pared with that in October was reported by every Service Command except the Third, Seventh, and Ninth Service Commands; in the latter two, only moderate increases occurred. The greatest decreases were registered in the First and Sixth Service Commands, in both of which the drop was about 10 percent.

The Third Service Command reported the highest admission rates from all causes and from disease in November (both being 20 percent higher than the country as a whole), closely followed by the Second Service Command. The lowest admission rate from all causes and from disease were again registered in the Eighth Service Command (both about 10 percent under the U.S. rates).

The highest morbidity from injury during November was reported by the Fourth Service Command (71 per thousand); only the Eighth Service Command, in addition to the Fourth, had a rate in excess of 60 per thousand. The lowest admission rates were recorded in the First, Third, and Sixth Service Commands and the Military District of Washington, all of which had rates of 40 to 45 per thousand.

RESPIRATORY DISEASES:

The November admission rate from colds, influenza, etc. was 93 per thousand or only fractionally higher than in October. For the last four months there has been a steady, although moderate, increase in morbidity from these causes from the very low level which prevailed during the summer months. The admission rate for November 1944 was 40 percent lower than for November 1943, towards the end of which month a notable outbreak of common respiratory infections began. During November 1944 there was a slight increase in morbidity from respiratory diseases reported by the shore stations of the Navy in this country.

Morbidity from colds, influenza, etc. increased significantly only in the Ninth Service Command, with sizeable decreases being recorded in the First and Second Service Commands and the Military District of Washington. The Military District of Washington reported the highest morbidity from these causes (139 per thousand) followed by the Second, Third, and Ninth Service Commands (about 113 per thousand); the lowest rates occurred in the Fourth and Eighth Service Commands (about 82 per thousand).

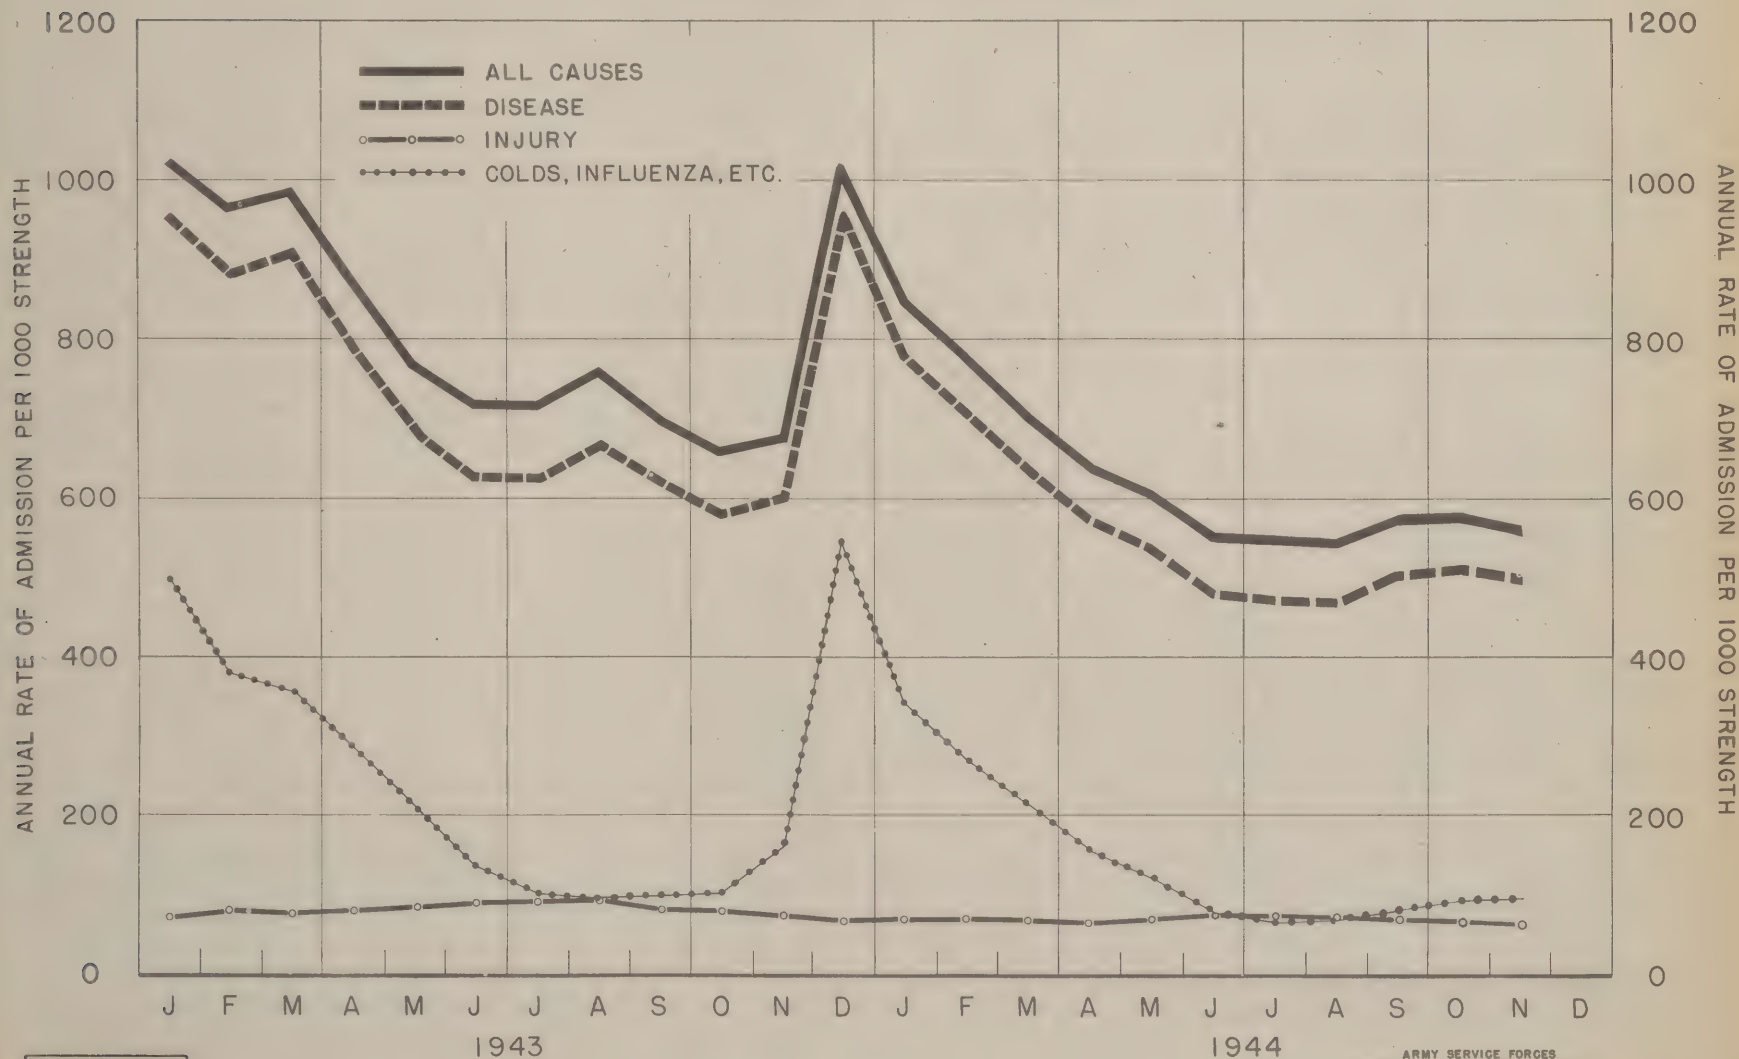

Morbidity from all forms of pneumonia combined increased about 10 percent during November. Nevertheless, current experience is about 20 percent lower than for November 1943 and is less than half the peak rate for December 1943.

Morbidity from pneumonia was higher in November in practically every Service Command. The Sixth Service Command continued to experience by far the highest admission rate from this cause; the November rate in this Command was about 20 percent higher than in October and more than double the November rate for the country as a whole.

In November, atypical pneumonia accounted for about two-thirds of all pneumonia admissions; this is a somewhat lower proportion than during the previous three months when 70 to 75 percent of the total cases were so reported. The percentage of pneumonia cases diagnosed as atypical was highest in the Second, Fourth, and Eighth Service Commands and the Military District of Washington, in all of which the proportion was 70 percent or more.

# MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery decreased by about 20 percent in November continuing on the normal seasonal trend. The admission rate for November 1944 (7.6 per thousand) was fractionally lower than that for the corresponding month of 1943.

VENEREAL DISEASES:

Morbidity from venereal disease, excluding cases contracted prior to entry into active service, increased by about 5 percent in November to 39.0 per thousand, which is the highest admission rate from these causes reported since February 1942. The Navy's experience with venereal diseases was slightly higher in November than in October and remained at a relatively high level as compared with previous months.

The admission rate for syphilis, excluding EPTS cases, recorded a slight increase in November, thus continuing the gradual upward trend which became evident about June, in sharp contrast with the previous downward trend which had been manifest since the beginning of the war.

Lower morbidity from venereal diseases, excluding EPTS cases, was reported by the First, Sixth, and Eighth Service Commands. A markedly higher admission rate was registered in the Third Service Command with most of the other Service Commands reporting moderate increases.

The highest morbidity from venereal disease, excluding EPTS cases, was reported by the Third and Fifth Service Commands which had rates about 50 percent higher than for the country as a whole. Relatively low admission rates were recorded in the Military District of Washington and the Ninth Service Command.

Morbidity represented by venereal EPTS cases was reported at 6.8 per thousand during November against 7.7 per thousand for October. The admission rate from this cause has been decreasing steadily during recent months as a result of the downward trend in the number of men inducted into the Army. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees.

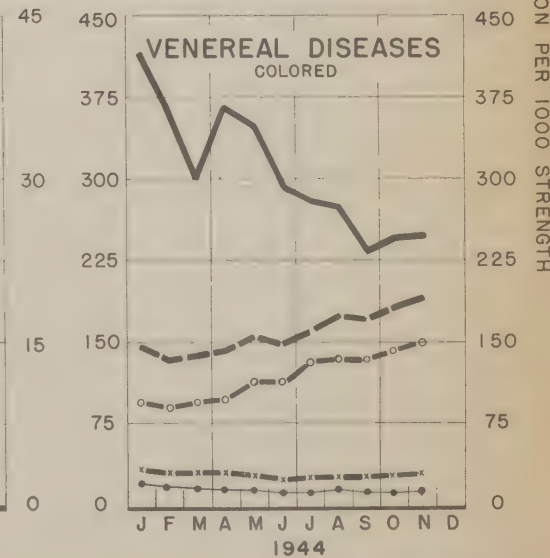

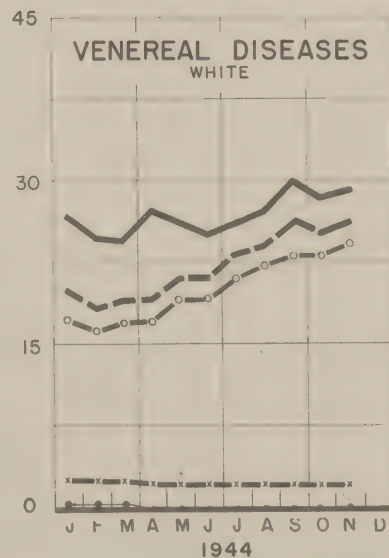

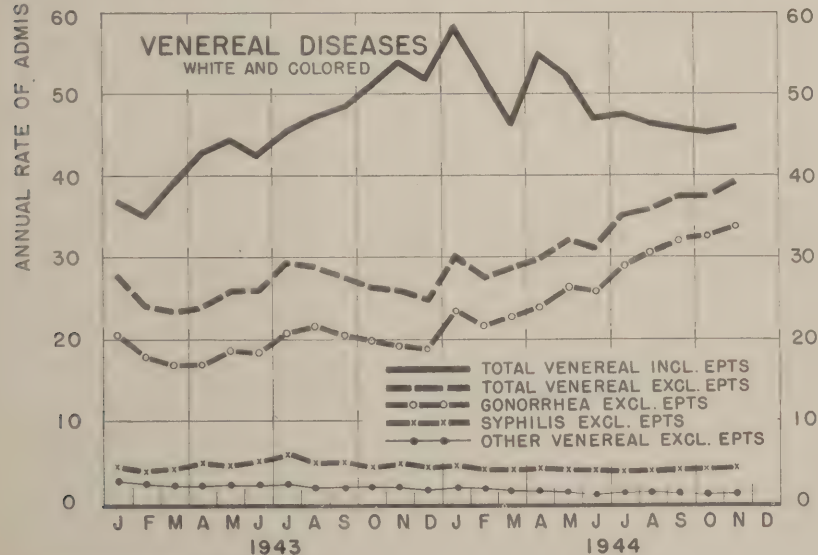

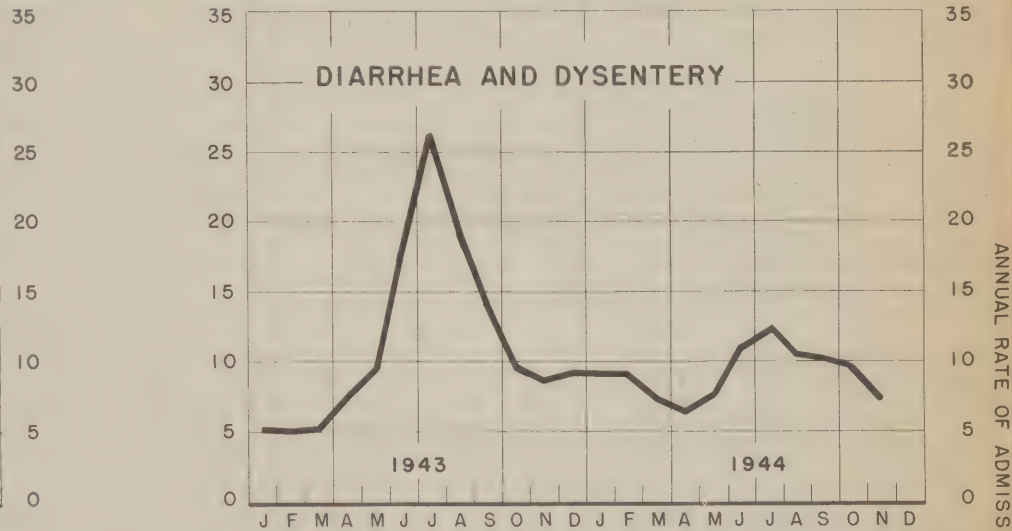

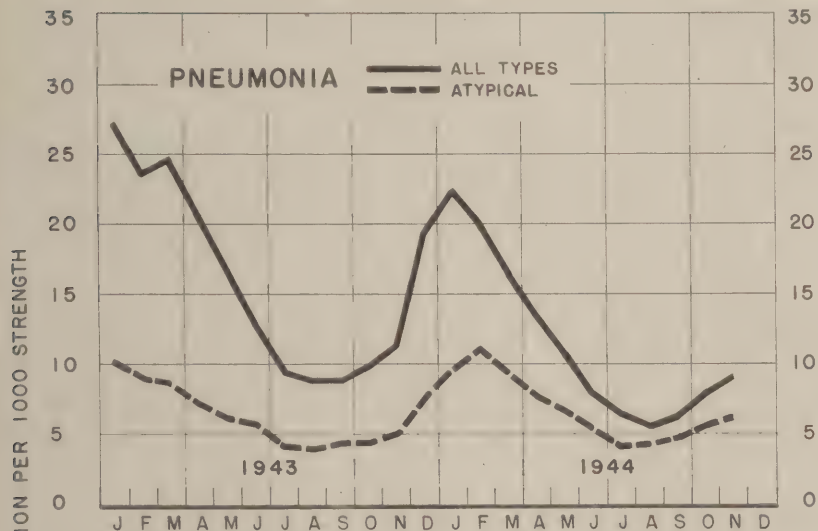

The venereal disease cases remaining under treatment on 24 November are shown below:

<u>Service Command</u>	<u>Number Remaining Under Treatment</u>		<u>Venereal Disease Cases as Percent of All Cases</u>	
	<u>Syphilis</u>	<u>Other</u>	<u>Syphilis</u>	<u>Other</u>
TOTAL U.S.	1524	1088	.89	.64
I	53	18	.91	.3
II	63	96	.5	.7
III	227	107	2.0	.9
MDW	12	29	.3	.8
IV	386	166	1.0	.4
V	72	117	.4	.7
VI	34	44	.4	.5
VII	90	115	.6	.7
VIII	357	220	1.2	.7
IX	230	176	.9	.7

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of November was about the same as for October, while the number of cases of other venereal diseases decreased 25 percent. Total venereal cases represented 1.50 percent of the total number of patients remaining under treatment in

# MORBIDITY FROM ——— PNEUMONIA DIARRHEA AND DYSENTERY VENEREAL DISEASES

CONTINENTAL UNITED STATES

RESTRICTED

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 11 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 60 percent of the cases remaining under treatment were syphilis cases.

The total number of days lost from duty during November because of venereal disease was about 76,000 or an average of 19,000 per week; this represented a non-effective rate of .80 per thousand or slightly lower than for the previous five months.

The very much higher incidence of venereal disease among colored as compared with white personnel is indicated in the chart on page 27. For colored troops in 1944 morbidity from venereal disease, excluding EPTS cases, has been consistently about seven times as high as for the remainder of the Army, while for EPTS cases the colored admission rate has been about 30 times as high. More detailed data as to the October incidence of venereal diseases by color are presented in the Special Health Report contained in Weekly Health Report No. 47 (page 25).

MEASLES:

Morbidity from measles decreased slightly to .1 per thousand, which is about the same as reported during the previous three months and well below that for the corresponding period of 1943.

MUMPS:

Morbidity from mumps increased about 50 percent in November, paralleling the sharp seasonal increase which occurred in November 1943. Nevertheless, the current level is only about one-tenth the peak rate usually reached in the spring months.

SCARLET FEVER:

Morbidity from scarlet fever increased slightly to .5 per thousand. Nevertheless, current experience is considerably lower than during the corresponding period of 1943.

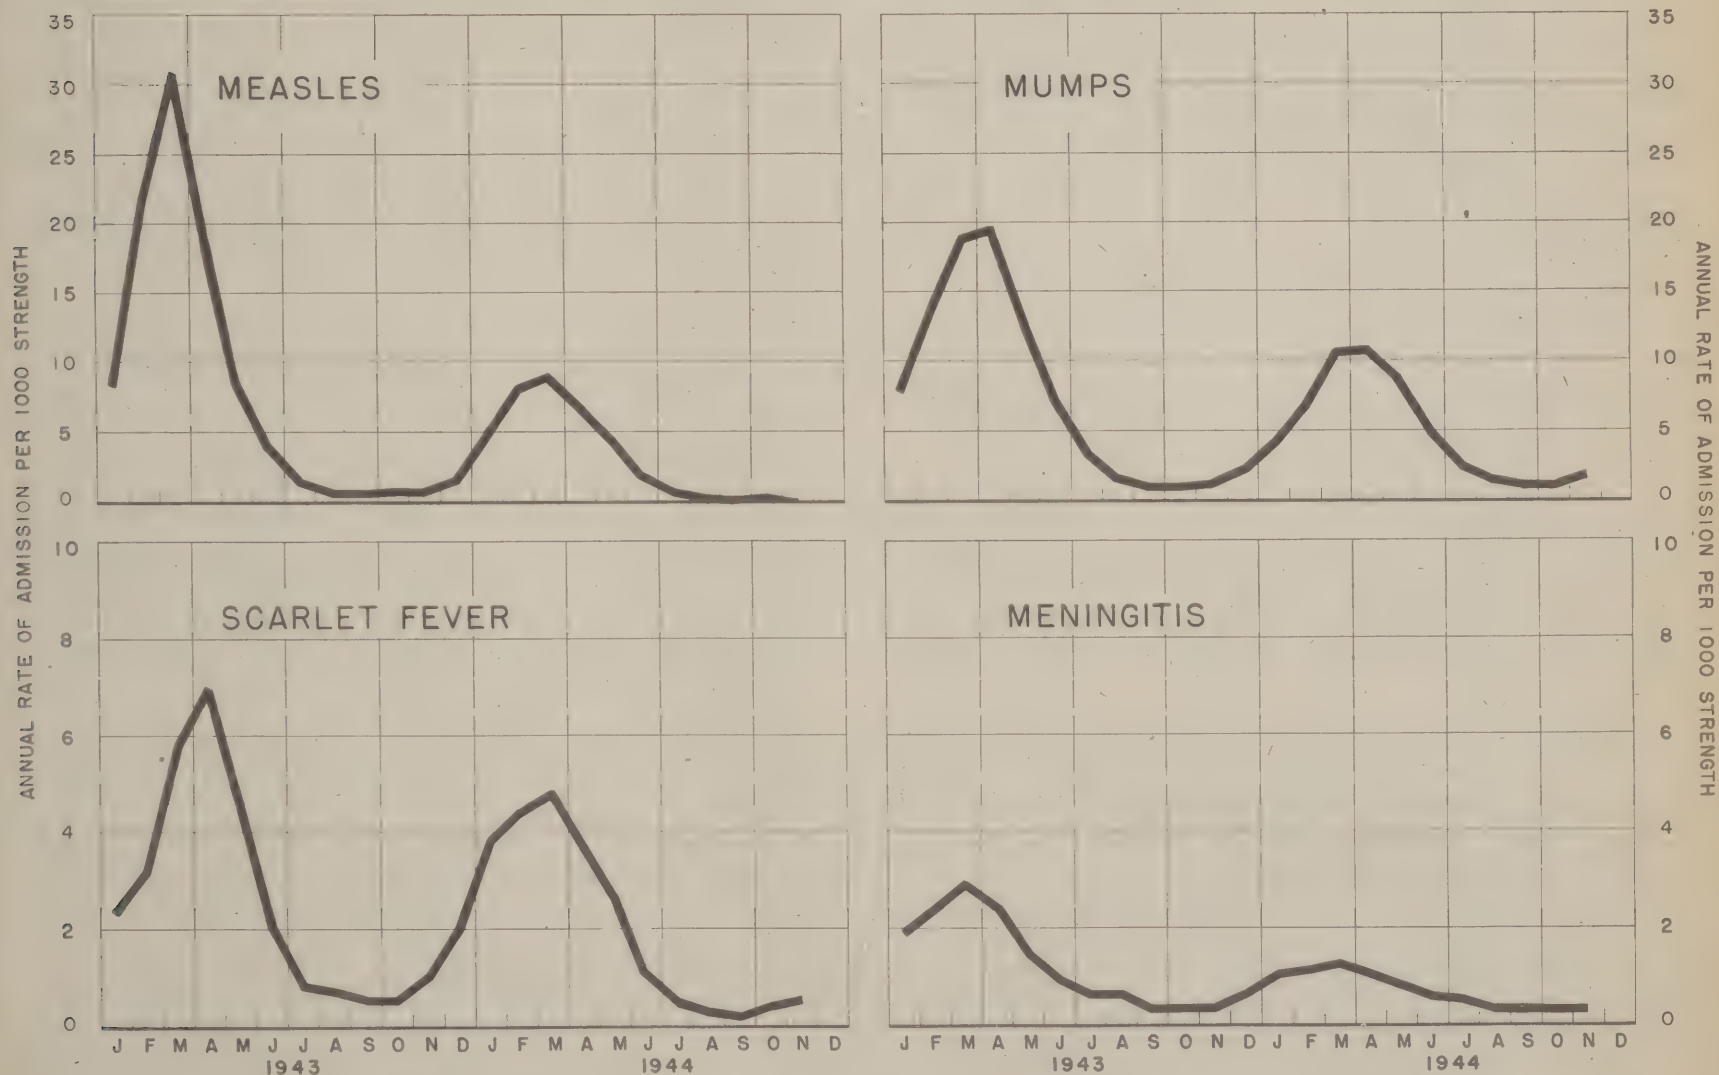

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis was reported at .3 per thousand for the fourth successive month. This is the same as during the period from September to November 1943 when the lowest morbidity from this cause was recorded for that year.

# MORBIDITY FROM — MEASLES — MUMPS

## SCARLET FEVER — MENINGITIS

CONTINENTAL UNITED STATES

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever increased fractionally to .8 per thousand or somewhat above the low level that has prevailed during the past 4 months and about the same as during the corresponding period of 1943. The Seventh Service Command with a rate almost four times as high as that for the remainder of the country continued to report the highest morbidity from this cause; the Ninth Service Command also reported a relatively high rate.

TUBERCULOSIS:

Morbidity from tuberculosis increased slightly to 1.1 per thousand, the highest rate reported so far this year. As of 24 November 1944 there were 1585 cases of tuberculosis remaining under treatment; these represented .93 percent of all patients in hospital. Of the 1585 cases remaining 566 were at Fitzsimons G.H. and 664 at Brun G.H.

MALARIA:

Morbidity from malaria acquired in the United States declined to .1 per thousand, indicative of the seasonal trend anticipated. The current experience is about the same as during the corresponding period of 1943.

The number of cases of malaria presumably acquired overseas which were admitted or readmitted for treatment in this country averaged about 900 per week or slightly above the weekly average for October and thus the highest figure so far recorded.

As of 24 November 1944 there were 2451 cases of malaria remaining under treatment, representing 1.4 percent of the total patients remaining in hospital. Only 12 of these 2451 cases of malaria were those where the disease was acquired in the United States.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders decreased slightly in November (to 47.3 per thousand) from the peak rate of 48.0 per thousand registered in October. In part the current relatively high level of admissions reflects the effects of WD Cir. 370, 12 September 1944 which provided that enlisted men not meeting minimum standards for induction and having no suitable assignment could be discharged. It is noteworthy that the rate of discharge for neuropsychiatric disorders has not increased, apparently because many mild psychiatric cases were discharged under Section X of AR 615-360 (now AR 615-365).

Significant decreases in morbidity from neuropsychiatric disorders in November as contrasted with October occurred in the First and Fifth Service Commands, while only in the Fourth and Sixth Service Commands were significant increases reported.

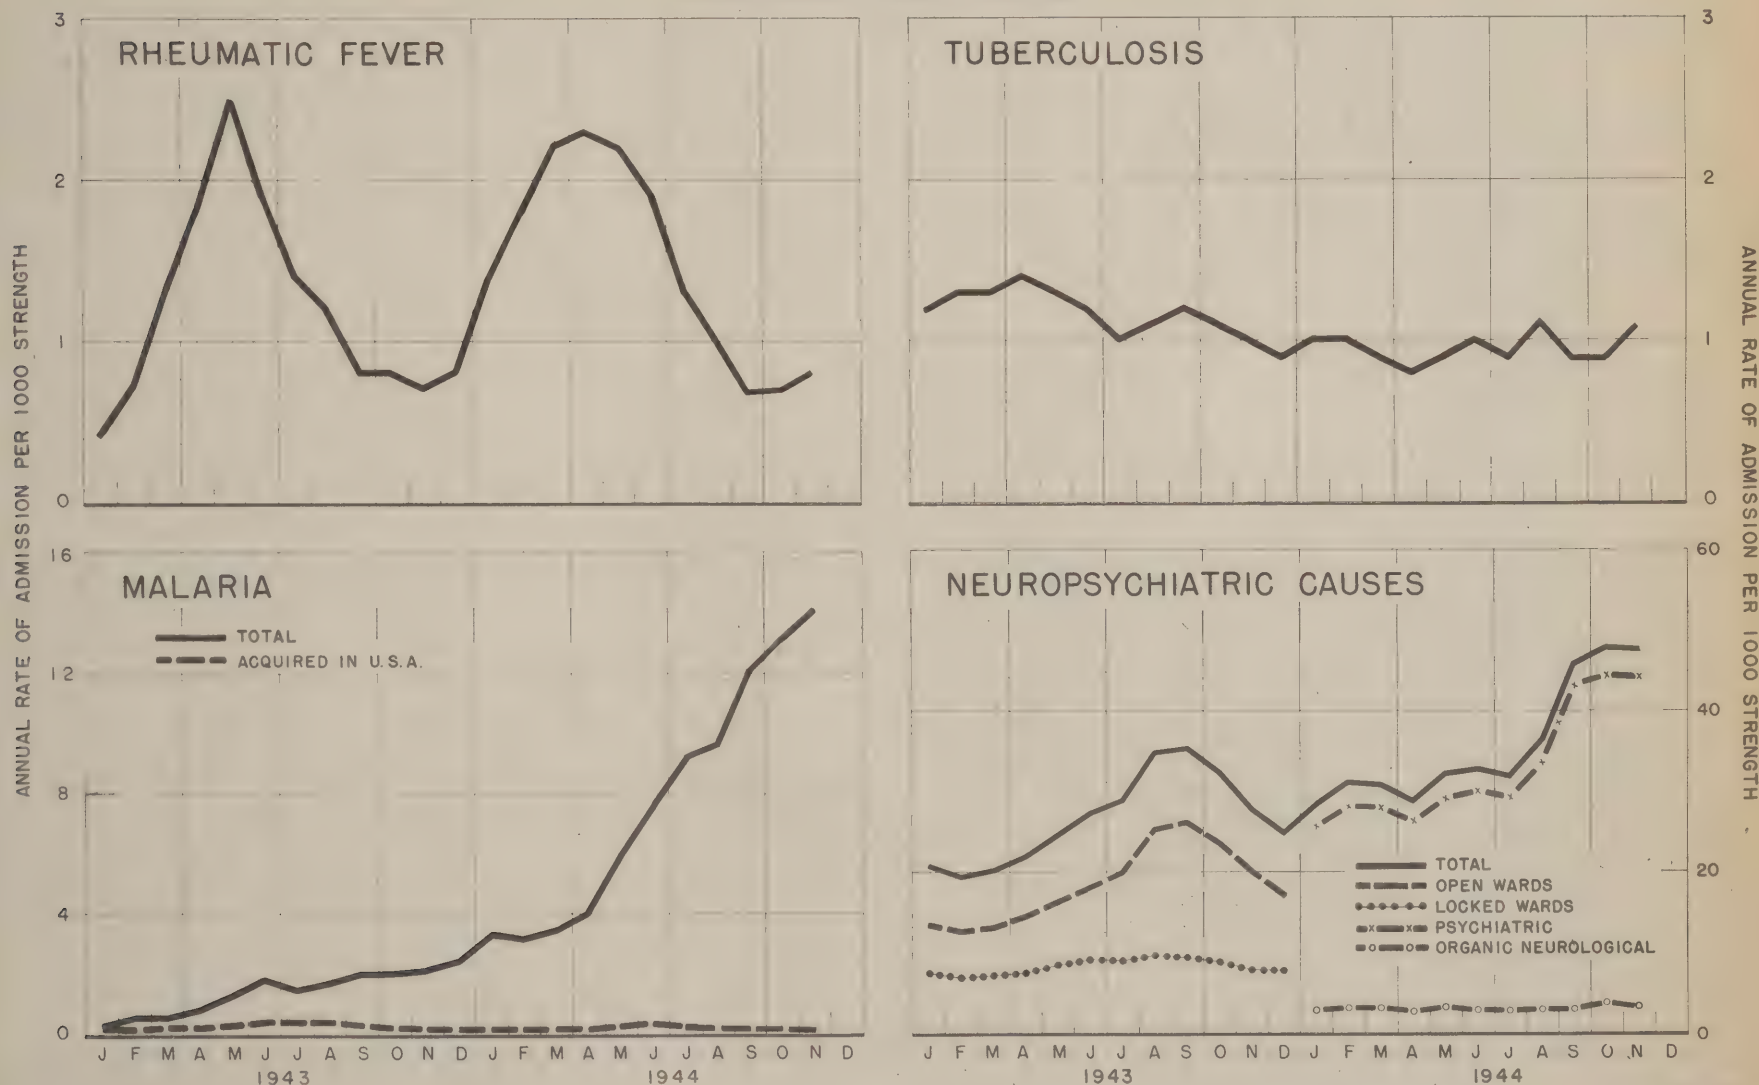

The Second Service Command reported by far the highest morbidity from neuropsychiatric disorders (72 per thousand), in large part because of relatively high admissions at Atlantic City AAF Redistribution Station and at General Hospitals. The lowest rate was reported in the Sixth Service Command (27 per thousand).

During November there was an average of 1840 CDD's per week given to enlisted men who were classified as neuropsychiatric cases; this is exactly the same weekly average as in October. The CDD's given in November for neuropsychiatric disorders represented 40 percent of all CDD's or about the same proportion as during May to September (about 42 percent), but higher than during October (36 percent).

In November organic neurological cases represented about the same proportion of the total neuropsychiatric

# MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

RESTRICTED

## COMMENT ON RECENT DEVELOPMENTS (CONT'D)

cases as in October (namely, about 7 percent). Only in the Fifth, Sixth, and Seventh Service Commands and the Military District of Washington did the proportion of organic neurological cases exceed 10 percent of the total neuropsychiatric cases.

The number of neuropsychiatric cases remaining under treatment as of 24 November 1944 was 19,940 or about the same as at the end of October, which was the highest level reported so far during this war. Both open ward and locked ward cases remained at about the same level in November as in October. Neuropsychiatric cases remaining represented 11.7 percent of all patients in hospital; open ward cases accounted for 8.6 percent and locked ward cases for 3.1 percent.

MORTALITY:

Mortality from all causes during November was reported at 2.53 per year per thousand strength or about the same as during October. The mortality rate from disease increased from .56 per thousand in October to .68 per thousand in November, the highest rate recorded since April 1943.

It should be noted that the reporting of deaths on Forms 86ab is not complete, particularly for deaths from injury for which the understatement may be as great as 15 percent. The mortality rate from injury when adjusted to allow for this under-reporting is about 2.1 per thousand, resulting in an estimated total death rate from all causes of 2.8 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for November was reported at 50.8 per thousand strength or 7 percent higher than in October; most of this increase arose because of an increase in hospital population at General Hospitals. Despite lower admission rates, the non-effective rate for November 1944 was 19 percent higher than for November 1943; this increase is more apparent than real since it is the result of the inclusion of days lost in General Hospitals by evacuees from overseas, who account for over 25 percent of the non-effective rate. The non-effective rate from injury in October was 9.2 per thousand, which is somewhat higher than in previous months.

Variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:

<u>Service Command</u>	<u>Including Gen. Hosp.</u>	<u>Excluding Gen. Hosp.</u>
TOTAL U.S.	50.8	26.7
I	65.7	19.7
II	62.3	22.2
